TITLE: The Effect of Deoxidation of Steel and its Treatment by Sodium Silicate on the Percentage of Non-Metallic Inclusions ✓

PERIODICAL: Stal', 1960, No. 4, pp. 305 - 307

TEXT: At the Severskiy metallurgicheskiy zavod (Seversk Metallurgical Plant) the effect of deoxidation by ferromanganese and ferrosilicon, as well as the effect of a treatment with sodium silicate and a sand-scale mixture on the steel in the furnace were investigated. The steel tested had the following composition: C: 0.13 - 0.16%; Mn: 0.30 - 0.40%; Si: \leq 0.03%; P: \leq 0.050%; S: \leq 0.055%. Melting was carried out according to the scrap process, in a basic, black oil fired Siemens-Martin open-hearth furnace. To deoxidation ferromanganese and an addition of blast-furnace ferrosilicon were applied, while for the slagging of floating inclusions on the surface of the molten metal a sand-scale mixture (65%: 35%) was dispersed. The percentage of inclusions in the metal varied between 0.03 - 0.07% and of this ✓

The Effect of Deoxidation of Steel and its Treatment by Sodium Silicate on the Percentage of Non-Metallic Inclusions

percentage the high-melting components (corundum, spinel) were 70 - 90%, deteriorating the quality of steel. The analysis of the test showed that upon adding ferrosilicon the percentage of high-melting inclusions decreased by about 20 - 30%, whereas that of the silicate inclusions increased by about 30 - 50%, while the grain size of the glasslike inclusions also increased (up to 0.3 - 0.5 mm² and more). Thus, under the influence of deoxidation with ferromanganese and ferrosilicon the high-melting components could be slagged more efficiently. Tochinskiy and Perren (Ref. 6) applied low-melting silicates to the removal of inclusions and impurities from the steel. In the process described in the present paper low-melting sodium silicate powder (24.1% Na₂O and 62.8% SiO₂) was applied as fluxing agent which easily forms drops on account of its low surface tension at the gas zone (300 erg/cm²). Sodium silicate was a) either sprinkled on the metal surface in the ingot mold or b) it was added partly to the metal when tapped from the furnace, partly to the ladle when one third full and finally it was also put into the ingot mold. In both test

The Effect of Deoxidation of Steel and its Treatment by Sodium Silicate on the Percentage of Non-Metallic Inclusions

series the metal was reduced in the furnace by ferromanganese only. 300 g of a mixture of 65% of sand and 35% of scale was added to one part of the ingot molds, whereas an equal amount of sodium silicate to the other ingot molds. In the slag samples taken from the castings treated without fluxing agents, 30 - 40% spinel, 15% ferric oxide, 10% silicate glass and up to 40% manganese orthosilicate were found. Table 1 shows that when adding sodium silicate to the ladle and to the ingot mold the total amount of inclusions is not affected, but their chemical composition is changed. SiO₂ increased from 10 - 15% up to 48%, whereas the content of the high-melting components (manganese oxide and in many cases ferro-oxide content) decreased, sometimes magnesium and chrome oxide were even completely lacking. The amount of waste products was also reduced by this process. When milling strips from 139 tons of casting treated by sodium silicate, the waste products amounted to 1,329 kg, whereas the corresponding figure from an equal amount of castings treated by sand-scale mixture was 2,125 kg. The plastic properties of the steel also improved (relative elongation increased from 31.8 to 33.2%) ✓

TITLE: Investigation of Extensive Atmospheric Showers of Cosmic Radiation Under Dense Substances (Issledovaniye shirokikh atmosferykh livney kosmicheskogo izlucheniya pod plotnym veshchestvom)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958, Vol 35, Nr 3, pp 618 - 630 (USSR)

ABSTRACT: The present paper deals with investigations of the absorption of atmospheric shower particles in an absorber with a low atomic number in an altitude of 3860 m above sea-level (Pamir Plateau, 1955). Measurements were carried out by means of a special arrangement of ionization chambers and groups of hodoscope counters (Fig 1). For the description see reference 4. The results obtained by measurements appear to prove that in extensive air showers with particle numbers of $10^4 < N < 10^5$ there is, on the average, equilibrium between the nuclear active and electron-photon components

Card 1/3

Investigation of Extensive Atmospheric Showers of Cosmic Radiation Under Dense Substances SOV/56-35-3-9/61

of the shower. This is in contradiction to the hypothesis according to which the formation of extensive showers is assumed to be a result of acts of nuclear interaction with total dissipation of the energy of primary particles; it also indicates the comparatively insignificant part played by fluctuations. The energy of the nuclear active component of a shower with $N < 10^5$ in the lowermost third of the atmosphere exceeds the energy of the electron-photon component by the 1,7-fold of its amount. A considerable part of this energy ($\sim 60\%$) is used for the production of myons and neutrinos. The variation of the absorption coefficient of an extensive air shower as well as the change of the structure of the shower core in transition from showers with $N < 10^5$ to showers with $N > 10^5$ agrees with the assumption (Ref 14) that the character of the elementary act of nuclear interaction is modified at an energy of $E_0 \approx 3 \cdot 10^{14}$ eV. The measured data obtained seem to show that the absorption of shower particles increases at transition to $N > 10^5$. Measurements were

"An Instance of the Isolation From Grey Field Mice of a Virulent Strain of Klebsiella pneumoniae Friedlaenderi, L. A. Pomsanskaya, Tula Oblast Antitularema Sta

"Zhur Mikrobiol, Epidemiol, i Immunobiol" No 1, pp 67-68

A virulent strain of K. pneumoniae Fr. was isolated from Microtus arvalis by the Bacteriol Lab of the Tula Oblast Antitularema Sta, which studies in addn to tularemia, other rodent epizootics that might be of danger to humans. The strain was

241717

Investigated by this lab and the Tularemia Lab, Div of Parasitol, Inst of Epidemiol and Microbiol, Acad Med Sci USSR. It was found to be identical with stock cultures of strains one of which was isolated from the corpse of a man who died of a hemorrhagic septic infection, one from the pathologically modified lung of another corpse, and one from a white mouse which died during an epizootic outbreak in a vivarium.

Engineralmostroyeniye (Power-Machinery Construction) Moscow
Mashiz 1960, 163 p. (Series, Iss: Trudy, No. 204) Errata
slip inserted. 1,600 copies printed.

Sponsoring Agency: NBSFR, Ministerstvo Vozhshgo i srednego spetsial'nogo obrazovaniya.

Resp. Ed.: V.S. Salmov, Doctor of Technical Sciences, Professor;
Ed.: V.I. Balluhin, Candidate of Technical Sciences, Docent; Tech.
Ed.: P.S. Prudnik; Managing Ed. for Literature on the Design and
Operation of Machinery (Leningrad Division, Mashiz); P.I. Pesti-
sov, Engineer.

PURPOSE: This book is intended for workers at scientific research
institutes and factory design offices. It may also be useful to
students of advanced courses and applicants specializing in
power-machinery construction.

CONTENT: This collection of 17 articles deals with analyses of
gas-turbine installations and theoretical and experimental in-
vestigations of the operation of power and transportation machinery,
including turbines, compressors, and internal-combustion engines.
A description is given of recent theoretical and experimental in-
vestigations undertaken by the Department of Power-Machinery Con-
struction, Leningradskiy Politekhnikheskiy Institut (Leningrad
Polytechnical Institute). The high speeds of operation and the per-
formance of methods of calculating and designing new power equip-
ment. References follow several of the articles.

~~REPORT~~ Pyatetskiy-Shapiro, I. I.; Volkonskiy, V. A.; Levina, L. V.; Pomanskiy, A.

ORG: Central Economics Mathematics Institute, Academy of Sciences SSSR (Tsentral'nyy ekonomiko-matematicheskii institut Akademii nauk SSSR)

TITLE: An iterative method of solving problems of integral programming

SOURCE: AN SSSR. Koklady, v. 169, no. 6, 1966, 1289-1292

TOPIC TAGS: iteration, iterated integral, mathematic analysis, integral programming

ABSTRACT: The iterative method proposed consists of the following: where it is required to maximize the linear functional

$$\sum_{j=1}^n c_j x_j \quad (1)$$

under condition

$$\sum_{j=1}^n a_{ij} x_j \leq b_i, \quad i = 1, \dots, m, \quad (2)$$

where the unknown quantities x_j ($j = 1, \dots, n$) take on the value 0 or 1 and all coefficients a_{ij} , c_j , b_i are non-negative, the solution is sought as follows. The

Card 1/2

UDC: 519.95

L 11448-67

ACC NR: AP6030650

quantity b_0 is fixed and the system of $m+1$ inequalities

$$\sum_{j=1}^n c_j x_j > b_0, \quad \sum_{j=1}^n a_{ij} x_j \leq b_i, \quad i = 1, \dots, m, \quad (3)$$

is solved by the iterative method. The initial selection x_j^0 is arbitrary. It is assumed the k -th step produces the set x_j^k ($j = 1, \dots, n$). The following equation system is computed

$$Ax \leq b, \quad (4)$$

Using random selection, the components of vector x_j^k with identical probability are changed, $p = \min(c, \max \Delta_i)$. It is assumed that $c = 1/2$. Thus, a new set $x^{(k+1)}$ ($j = 1, \dots, n$) is produced, and the subsequent iteration is performed. When all Δ_i disappear, the solution is found. Then, increasing b_0 , solution is performed for a new system which is closer to the solution of the initial problem. The process is completed when the system of inequalities ceases to be solved after a fixed number of iterations. The paper was presented by Academician L. V. Kantorovich, Sep 7 1965. The authors express their gratitude to A. D. Shapiro for participating in composition of the examples and discussions of the results. Orig art. has: 1 table and 4

formulas.
